[Za kolegij]

Proteins and Protein Modifications

Study programme:	**Medical Studies in English (R)** (elective) [Sveučilišni integrirani prijediplomski i diplomski studij]
Department:	**[Centar za proteomiku]**
Course coordinator:	**prof. dr. sc. Lenac Roviš Tihana**
Year of study:	**2**
ECTS:	**1.5**
Incentive ECTS:	**0 (0.00%)**
Foreign language:	**Possibility of teaching in a foreign language**

Course information:

COURSE CONTENT:

L1 (2h): Proteins – Structure and Representation models
Explore the diverse world of proteins, the building blocks of life, in this foundational lecture. Gain insights into the basic structure of proteins, including domains, motifs, and mutations, and learn how different models are used to represent these complex molecules. By examining examples such as opsin protein mutations, you will discover how structural variations can influence biological processes and contribute to conditions like color blindness.

L2 (2h): Membrane Proteins and Sorting
Delve into the intricate architecture of membrane proteins and their essential roles in cellular function. This lecture covers how proteins are processed and transported within the cell, ensuring proper localization and function. By exploring the journey of proteins through cellular compartments, you will uncover the mechanisms that drive cellular communication and molecular trafficking, fundamental to maintaining cellular health.

L3 (1h): Detailed Case Study – Cohlin Mutation and Deafness
Engage with a real-life case study in this session, focusing on the Cohlin mutation and its role in hearing loss. Through this example, you will see how molecular tools can be used to correct protein mutations and address disorders. This lecture provides a practical application of the concepts learned in previous sessions, offering insight into the latest advancements in protein correction techniques and their potential to treat genetic diseases.

L4 (1h): Protein Modifications
Unlock the secrets of protein modifications and their profound effects on protein function and stability. In this lecture, you will explore how chemical changes, such as glycosylation and phosphorylation, shape protein interactions and dictate their role in biological processes. By understanding these modifications, you will gain insight into how proteins are tailored to meet the demands of the cellular environment, and how errors can lead to disease.

L5 (1h): Incorrect Protein Folding – Its Role in Disease
Discover the crucial link between protein misfolding and disease in this session. Learn how the failure of proteins to fold correctly can lead to the formation of harmful aggregates and amyloids, contributing to conditions like Alzheimer's and Parkinson's. This lecture sheds light on the cellular mechanisms responsible for maintaining protein integrity and the devastating consequences when these systems break down.

L6 (2h): Protein Engineering – Possibilities of Genetic Modification
Enter the cutting-edge field of protein engineering, where genetic modification opens up new possibilities for designing proteins with novel functions. In this lecture, you will explore the technologies used to engineer proteins, from recombinant protein production to the development of therapeutic proteins. Witness how these innovations are revolutionizing the treatment of diseases and paving the way for future breakthroughs in medicine.

L7 (1h): Insulin – A Pioneer in the Use of Biologic Recombinant Drugs
Take a journey into the history of biotechnology by examining insulin, the first recombinant protein used in medicine. This session explores the development of insulin as a life-saving treatment for diabetes and highlights the transformative impact of recombinant protein technology. Learn how this pioneering advancement set the stage for the creation of modern biologic drugs, reshaping the landscape of therapeutic medicine.

E1 (3h): Protein Isolation from Mouse Brain
Engage in a captivating experiment to isolate proteins from mouse brain tissue. In this session, you will experience firsthand the techniques used to extract proteins, gaining valuable insights into the steps required for protein preparation and purification. This foundational experiment sets the stage for subsequent analyses, allowing you to explore the complexity of protein composition in a biological sample.

E2 (4h): Protein Separation and Electrophoresis Analysis
Dive deeper into protein analysis through electrophoresis, a powerful technique for separating proteins based on size and charge. You will explore how to analyze protein samples to confirm whether the mouse has been knocked out for a specific gene, investigate the disulfide bonds in immunoglobulins, or visualize the recombinant SARS-CoV-2 protein N on a gel. This session provides critical experience in protein characterization and helps you unravel the molecular structure of proteins in various contexts.

E3 (2h): Bioinformatics Tools for Protein Analysis
Discover the essential bioinformatics tools used in protein analysis. In this session, you will learn to navigate online resources

to interpret primary amino acid sequences of proteins, unlocking the power of computational analysis in modern biology. This hands-on experiment equips you with the skills to extract meaningful data from protein sequences, enhancing your ability to analyze and understand complex biological information.

Seminars (6h): Engaging Discourse - Exploring the Frontiers of Protein Science

Participate in guided online seminars that encourage engaging discourse and exploration at the frontiers of protein science. Through a structured approach, students will prepare and deliver presentations, sparking insightful discussions and critical thinking. Topics can range from student-selected subjects to timely and relevant issues, such as the Spike protein of the SARS-CoV2 virus. Join this dynamic forum where knowledge meets innovation, fostering a deeper understanding of protein science.

COURSE OBJECTIVES:

The main objective of this course is to enhance students' understanding of proteins and broaden their knowledge of protein modifications.

This includes exploring natural protein modifications that facilitate specific functions, such as timely activation or precise cellular targeting, along with the fundamental methods employed for studying these modifications.

Additionally, the course aims to provide insights into undesired protein modifications that underlie various diseases, including the formation of insoluble aggregates implicated in severe neurodegenerative disorders. This will enable students to grasp the physiological and pathophysiological processes that rely on proteins.

Moreover, deliberate introduction of modifications or mutations will be addressed, focusing on the creation of recombinant proteins that exhibit enhanced stability or specificity for specific cell types. This has significant implications in the development of pharmacologically effective and targeted biological drugs.

Lastly, the course will encompass the study of pathogenic proteins, encompassing emerging pathogens, such as the proteome of the SARS-CoV2 virus, which is of current interest and relevance.

List of assigned reading:

Berg JM, Tymoczko JL, and Stryer L: Biochemistry Stryer – selected chapters

List of optional reading:

Selected scientific and professional papers and review papers from the course topic

Curriculum:

Lectures list (with titles and explanation):

L1 (2h): Proteins – Structure and Representation models

The student will be able to:

- Define key protein-related terms, including cytoplasmic domain, transmembrane domain, ectodomain, receptor-ligand interaction, domain, motif, conformation, wild-type, and mutant.
- Understand different professional models for protein representation and evaluate their advantages and limitations.
- Discuss the impact of protein mutations, using opsin protein mutations as an example to illustrate different types of color blindness

L2 (2h): Membrane proteins and Sorting

The student will be able to:

- Describe structural features of membrane proteins.
- Explain the fundamentals of cellular compartments involved in protein maturation and transport.

L3 (1h): Detailed case study (Cohlin mutation and deafness)

The student will be able to:

- Identify the Medical Faculty of the University of Rijeka as a member of the YUFE network and learn about the collaborative research with the YUFE member from the University of Antwerp.
- follow a real-life example of developing molecular tools to correct protein mutations that cause disorders (e.g., hearing loss), using the terminology introduced in lectures 1 and 2.

L4 (1h): Protein modifications

The student will be able to:

- Define the process and significance of disulfide bonds, glycosylation, phosphorylation, lipidation, and protein anchoring.
- Discuss the factors that influence the stability of protein-based drugs and receptor-ligand interactions.

L5 (1h): Incorrect protein folding – its role in disease

The student will be able to:

Describe the fundamentals of protein degradation.

Explain the basics of the process of insoluble protein aggregate formation (aggregates, amyloids).

L6 (2h): Protein engineering – possibilities of genetic modification

The student will be able to:

Define the following terms related to proteins and their modifications: recombinant protein.

Discuss the potential applications of genetic modification of proteins.

L7 (1h): Insulin – a pioneer in the use of biologic recombinant drugs

The student will be able to:

Describe the basic structural characteristics of insulin.

Explain the advantages of producing recombinant drugs.

Exercises list (with titles and explanation):

E1 (3h): Isolation of proteins from biological samples

the student will be able to:

1. Explain the method of protein isolation from biological samples using tissues such as the brain as an example.
2. List the basic methods for determining protein concentration.
3. Under supervision, perform protein isolation experiments from tissues and determine their concentration using standard biochemical methods.
4. Apply mathematical methods for data analysis and processing (determining the concentration of isolated proteins based on a standard curve).
5. Write a report on the performed experiments.

E2-a: Introduction to protein analysis

The student will be able to:

Independently perform protein detection under supervision.

E3 (2h): Basic informatic tools for protein analysis

The student will be able to:

1. Independently retrieve the amino acid sequence of any protein from online sources and perform basic analyses such as searching for related sequences or identifying functional domains.

E2-b: Introduction to protein analysis

Ishodi učenja

The student will be able to:

Independently perform protein detection under supervision.

Seminars list (with titles and explanation):

Seminars (3h delivered on this day out of a total of 6h).

Seminars (6h): Guided online classes, step-by-step seminar preparation with instructions, corrections, use of online tools and resources, short student presentations with discussion, topics of choice or work on current topics (example: Spike protein of the SARS-CoV2 virus) are planned.

Student obligations:

redovito pohađanje nastave (predavanja, seminari, vježbe)

izrada seminarskog rada/polaganje završnog ispita

Exam (exam taking, description of the written/oral/practical part of the exam, point distribution, grading criteria):

Other notes (related to the course) important for students:

Throughout the course, students will gain insight into protein analysis methods that are routinely conducted at the host institution and are commonly sourced from external providers. They will also explore the types of assistance they can expect to receive in their future experimental work and professional development. This exposure will not only provide them with a comprehensive understanding of the practical aspects of protein analysis but also equip them with valuable knowledge and support for their future endeavors in experimental research and professional growth.

COURSE HOURS 2024/2025

Proteins and Protein Modifications

Lectures (Place and time or group)	**Exercises** (Place and time or group)	**Seminars** (Place and time or group)
16.10.2024		
L1 (2h): Proteins – Structure and Representation models: • [Centar za proteomiku] (15:30 - 17:01) [180] ○ PAPM		
prof. dr. sc. Lenac Roviš Tihana [180]		
23.10.2024		

L2 (2h): Membrane proteins and Sorting:
• [Centar za proteomiku] (15:00 - 17:30) [180]
  ○ PAPM
 	
L3 (1h): Detailed case study (Cohlin mutation and deafness):
• [Centar za proteomiku] (15:00 - 17:30) [180]
  ○ PAPM		

prof. dr. sc. Lenac Roviš Tihana [180]		
31.10.2024		

L4 (1h): Protein modifications:
• [Centar za proteomiku] (15:30 - 17:00) [180]
  ○ PAPM
 	
L5 (1h): Incorrect protein folding – its role in disease:
• [Centar za proteomiku] (15:30 - 17:00) [180]
  ○ PAPM
	E1 (3h): Isolation of proteins from biological samples:
	• [Centar za proteomiku] (08:00 - 11:00) [187]
	  ○ PAPM
		Seminars (3h delivered on this day out of a total of 6h).:
		• [ONLINE] (17:00 - 19:15) [180]
		  ○ PAPM

Kveštak Daria, mag. biol. mol. [187] · prof. dr. sc. Lenac Roviš Tihana [180]		
05.11.2024		
	E3 (2h): Basic informatic tools for protein analysis: • [P03 - INFORMATIČKA UČIONICA] (16:00 - 18:00) [204] ○ PAPM	
Kučan Brlić Paola, PHD [204]		
08.11.2024		
L7 (1h): Insulin – a pioneer in the use of biologic recombinant drugs: • [ONLINE] (17:30 - 18:16) [202] ○ PAPM		
izv. prof. dr. sc. Brizić Ilija, mag. ing. biotechn. [202]		
20.11.2024		

L6 (2h): Protein engineering – possibilities of genetic modification:
• [ONLINE] (16:30 - 18:01) [180]
  ○ PAPM
		Seminars (3h delivered on this day out of a total of 6h).:
		• [ONLINE] (18:01 - 20:16) [180]
		  ○ PAPM

prof. dr. sc. Lenac Roviš Tihana [180]		
27.11.2024		

	E2-a: Introduction to protein analysis:
	• [Centar za proteomiku] (15:00 - 16:30) [180] [1625]
	  ○ PAPM
	
	E2-b: Introduction to protein analysis:
	• [Centar za proteomiku] (16:31 - 18:01) [180] [1412]
	  ○ PAPM	

prof. dr. sc. Lenac Roviš Tihana [180] · Malić Suzana [1625] · Miklić Karmela [1412]		

List of lectures, seminars and practicals:

LECTURES (TOPIC)	Number of hours	Location
L1 (2h): Proteins – Structure and Representation models	2	[Centar za proteomiku]
L2 (2h): Membrane proteins and Sorting	2	[Centar za proteomiku]
L3 (1h): Detailed case study (Cohlin mutation and deafness)	1	[Centar za proteomiku]
L4 (1h): Protein modifications	1	[Centar za proteomiku]
L5 (1h): Incorrect protein folding – its role in disease	1	[Centar za proteomiku]
L6 (2h): Protein engineering – possibilities of genetic modification	2	[ONLINE]
L7 (1h): Insulin – a pioneer in the use of biologic recombinant drugs	1	[ONLINE]

EXERCISES (TOPIC)	Number of hours	Location
E1 (3h): Isolation of proteins from biological samples	3	[Centar za proteomiku]
E2-a: Introduction to protein analysis	2	[Centar za proteomiku]
E3 (2h): Basic informatic tools for protein analysis	2	[P03 - INFORMATIČKA UČIONICA]
E2-b: Introduction to protein analysis	2	[Centar za proteomiku]

SEMINARS (TOPIC)	Number of hours	Location
Seminars (3h delivered on this day out of a total of 6h).	6	[ONLINE]

EXAM DATES (final exam):

1.	06.12.2024.
